Reviews

This publication is definitely not simple to begin on studying but quite fun to see. It really is full of knowledge and wisdom I am just effortlessly can get a satisfaction of studying a created pdf.
(Alfreda Bradtke)

VOYAGE EN FRANCE (11)

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 24 pages. Original publisher: Reston, Va. : U. S. Geological Survey, 2008. OCLC Number: (OCoLC)231624081 Subject: Hydrologic models -- Mauritania. Excerpt: . . . computing local minima, particularly for nonlinear problems and when using gradient-based parameter estimation algorithms. A second alternative in predictive analysis is the direct estimation of nonlinear prediction limits (Veccia and Cooley, 1989). This method assumes that there is a best-fit set of nonunique model parameter values. That is, there is a single global minimum objective function value (determined, for example, using a calibrated model), but because of the limited information content used to constrain the solution space, there are infinite combinations of parameter value that satisfy the predictive solution. This method appears to be relatively robust. One disadvantage, however, is that one complete estimation problem must be solved for each prediction limit being evaluated. A third alternative in the analysis of predictive uncertainty is the Markov-Chain Monte Carlo method (Kuczera, 1998; Campbell and others, 1999; Bates and Campbell, 2001). Markov-Chain methods have become important for generating sequences of random numbers to accurately reflect complicated desired-probability distributions. In recent years this approach has improved the practicability of Bayesian inference methods. In hydrologic modeling, a Markov-Chain model is a dynamic hybrid of probability and matrix models. For example, the probability matrix of the Markov-Chain model can be determined from the ground-water table elevation time series. In this case, the probability reflects the likelihood of the ground-water table changing between levels. The Shuffled Complex Evolution Metropolis method (Vrugt, 2003) was recently devised for single-and multi-objective calibration of hydrologic models. This algorithm is a general-purpose optimization algorithm that uses adaptive Markov-Chain Monte Carlo sampling to provide an efficie.
